

ABSTRACT

Cosmetic composition containing a polymer and a fluoro oil

The invention relates to a physiologically acceptable composition, especially a cosmetic composition, containing at least one liquid fatty phase comprising at least one fluoro oil, the liquid fatty phase being structured with at least one polymer with a weight-average molecular mass of less than 1 000 000, in particular ranging from 1 000 to 30 000, comprising

a) a polymer skeleton having hydrocarbon-based repeating units containing at least one hetero atom, and b) pendent and/or terminal fatty chains that are optionally functionalized, containing from 6 to 120 carbon atoms and being linked to these hydrocarbon-based units, the liquid fatty phase and the polymer forming a physiologically acceptable medium. This composition is especially in the form of a stick of lipstick which, when applied, gives a noteworthy glossy, non-sticky deposit that has good staying power over time and is transfer-resistant.
